Sleep and recall in older adults

A randomized controlled trial (RCT) of 240 adults aged 65 to 80

Results

Recall improved by 4.2 points in the sleep group (95% CI 2.1 to 6.3).

The control group changed by 0.6 points (SD 3.9).

An ANOVA found no effect of age band on the size of the change.

Discussion

The CI excludes zero, so the effect is unlikely to be chance alone.

A longer follow-up would show whether the effect lasts.
